

CYS1341 High Sensitive Omnipolar TMR Switch IC

CYS1341 is a digital omnipolar magnetic switch that integrates TMR and CMOS technology in order to provide a magnetically triggered digital switch with high sensitivity, high speed, and ultra-low power consumption. It is designed for use in applications that are both power-critical and performance-demanding. It contains a push-pull half-bridge TMR magnetic sensor and CMOS signal processing circuitry within the same package, including an on-chip TMR voltage generator for precise magnetic sensing, a TMR voltage amplifier and comparator with a Schmitt trigger to provide switching hysteresis for noise rejection, and CMOS push-pull output. An internal band gap regulator is used to provide a temperature compensated supply voltage for internal circuits, permitting a wide range of supply voltages. The CYS1341 draws only 1.5 μ A resulting in ultra-low power operation. It has fast response, accurate switching points, excellent thermal stability, and immunity to stray field interference. It is available in the LGA2x1.5x0.63 -3L package.

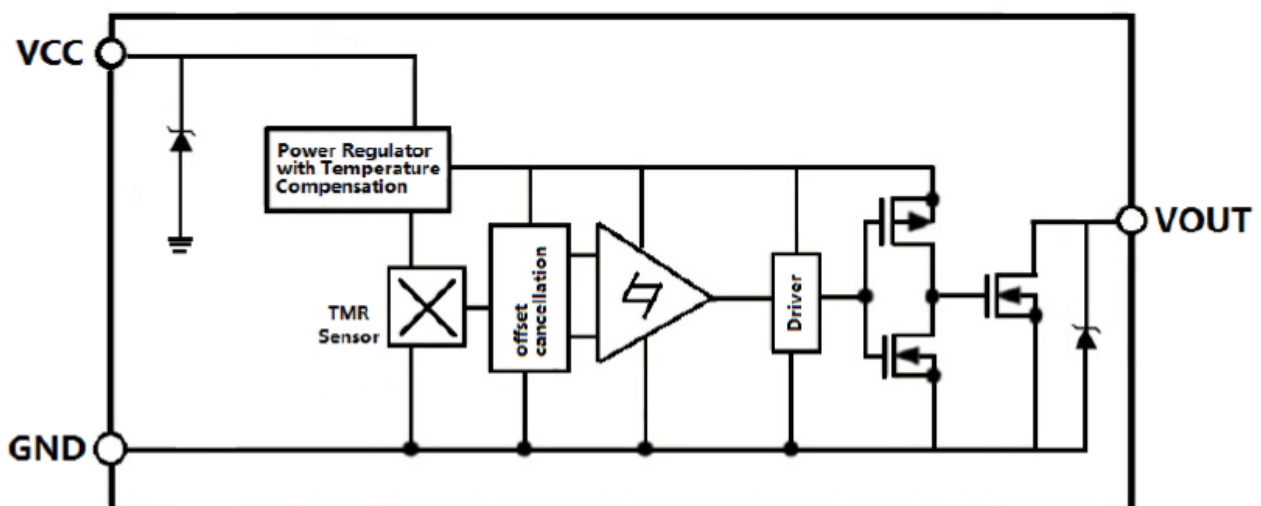

Features

- Bipolar latching operation
- Low power consumption (<1.5 μ A)
- Z-axis sensing direction compatible with Hall Effect Switch ICs
- Low switch points for high sensitivity
- Excellent thermal stability

Typical Applications

- Water, gas and heat meters
- High Sensitive Non-contact Switch
- DC Brushless Motor
- DC Brushless Fan
- Position and speed sensing

Output Behavior vs. Magnetic Pole

Parameter	Test Conditions	Output
South Pole	$B > B_{OPS}$	Low (On)
	$0 < B < B_{RPS}$	High (Off)
North Pole	$B < B_{OPN}$	Low (Off)
	$0 > B > B_{RPN}$	High (On)

Note: when power is turned on under zero magnetic field, the output is “High”.

Application Information

The output of the CYS1341 switches low (turns on) when a magnetic field to the sensing axis exceeds the operate point threshold, B_{OP} . When the magnetic field is reduced below the release point, B_{RP} , the device output switches high (turns off). The difference between the B_{OP} and B_{RP} is the hysteresis B_H of the device.

It is strongly recommended that an external bypass capacitor be connected in close proximity to the device between the supply and ground to reduce noise. The typical value of the external capacitor is $0.1\mu F$. $1k\Omega$ is a pull-up resistor.
